

Conclusion for Group Sprint 0

This project was largely focused on getting used to some of the methods we'll need throughout the course. We managed to get a relatively good introductory grasp on a broad range of topics. This was the advantage of leaving different members to independently work on the same set, we came back together and got to explore what each of us did and learned- on a data set we were all familiar with. You can see how we looked at ways to tidy up the data and explore it's contents. We went further, each trying to work on topics we covered in lectures- such as decision trees, random forests or cross-validation. Overall we think we were successful in the aims of this project; compiling data and resources and taking the first steps into Data Science.
